

Each User has a unique `userId`, `password`, `loginStatus`, and `registerDate`
(A user can log in to the system using their credentials (verify login

A Customer is a type of User who can register, log in, and update their profile
Each customer record includes their `customerName`, `address`, `email`, `creditCardInfo`,
`shippingInfo`, and `accountBalance`

An Administrator is also a type of User, with additional data such as `adminName` and `email`
Administrators are responsible for updating the product catalog

Every Customer owns exactly one Shopping Cart at a time
The cart contains items that the customer intends to purchase
A cart is identified by a `cartId` and stores the `productId`, `quantity`, and `dateAdded` for each item
Customers can perform actions like `addCartItem()`, `updateQuantity()`, `viewCartDetails()`, and `()checkout`

A Customer may place zero or more Orders
.Each Order belongs to exactly one Customer
Each order has an `orderId`, `dateCreated`, `dateShipped`, `status`, and is linked to a specific
.ShippingInfo record
()The main operation is `placeOrder`

An Order is made up of one or more Order Details
.Each order detail includes `orderId`, `productId`, `productName`, `quantity`, `unitCost`, and `subtotal`
It provides the operation `calcPrice()` to compute the subtotal

Each Order uses exactly one Shipping Info entry
,A shipping record has a `shippingId`, `shippingType`, `shippingCost`, and `shippingRegionId`
()and supports the operation `updateShippingInfo`
The same shipping info can be reused for multiple orders

,When a Customer account is deleted, their Shopping Cart should be removed automatically
but their past Orders remain for historical reference

,A Customer can have multiple Orders, each of which can contain multiple Order Details
and each Order must have exactly one Shipping Info
